

### Appendix 3: Proposed New Pathway to Net Zero in 2027

#### Proposed new interim emissions targets

The previously modelled pathway to net zero forecast ambitious reduction targets, ending with -1.4 ktCO<sub>2</sub>e. Given performance to date, it is recommended that the new pathway to net zero is reflective of additional work required, reaching 0 ktCO<sub>2</sub>e in 2027.

The new interim emissions targets would be -67% in 2024/25 (rather than -91%) and -77% in 2025/26 (rather than -96%).
